About

MISSION

*to expand access to clean energy, building a
brighter, more sustainable, and
environmentally conscious future*

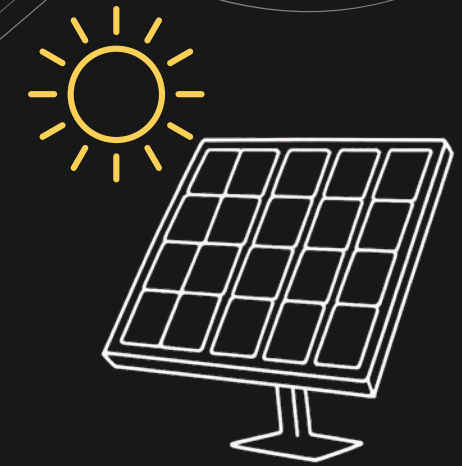

With years of experience in the photovoltaic sector, we bring passion, technical expertise, and a strong environmental commitment to every project. We believe that every energy choice is also a choice of responsibility - towards the planet, future generations, and our present. We provide customized, innovative, and reliable photovoltaic solutions, delivering solar energy directly to homes, businesses, and communities. Each installation marks a meaningful move toward energy self-sufficiency and environmental protection.

Choosing **Eurodistribuzione** means more than selecting a photovoltaic panel supplier - it means choosing a **strategic partner** in the transition to sustainable energy.

Servizi

Services

INSTALLATION

The type of installation largely depends on the intended use, system size, and the nature of the structure on which it is installed.

MAINTENANCE

It is a critical activity to keep a solar system running efficiently, reliably, and for as long as possible.

MONITORING

Regular checks of the system's energy production, comparing it with historical data and production forecasts.

Solutions

Every solar installation is tailored to the customer's needs and the unique features of the site, considering elements like sun exposure, roof or ground size, energy usage, and available budget.

The type of installation largely depends on the intended use, system size, and the nature of the structure on which it is installed.

Residential

Panels are typically mounted on the rooftops of single-family homes, duplexes, or apartment buildings. These systems are designed to cover the home's energy consumption

Commercial & Industrial

Rooftop systems on industrial buildings and commercial facilities; Building Integrated Photovoltaics - BIPV; Solar farms (or ground-mounted industrial systems)

Self-consumption

Systems with energy storage: they store solar energy in batteries, allowing it to be used during period of low solar production

Systems without energy storage: In some cases, solar energy is consumed in real time or fed into the public grid.

Tracking

Solar tracking systems: These photovoltaic systems are equipped with tracking mechanisms that allow panels to follow the sun's movement throughout the day.

Floating

They are installed on water surfaces such as lakes, tanks, or artificial basins.
